

In re Patent Application of:
ROCHE ET AL.
Serial No. 10/814,823
Confirmation No. 5289
Filing Date: March 31, 2004

In the Claims:

1. (Currently Amended) A microprocessor comprising:

- a processing unit;
- a memory connected to said processing unit and comprising an addressable memory space for a lower memory area and an extended memory area;
- means for connecting to and accessing said addressable memory space;
- means for executing instructions of an instruction set executable by said processing unit, the instruction set comprising instructions for accessing said addressable memory space, ~~the instruction set comprising~~ a first instruction group comprising instructions for accessing said lower memory area, and a second instruction group distinct from the first instruction group and only comprising all of the ~~for gathering~~ instructions in the ~~instruction set~~ for accessing said extended memory area; and
- means for preventing access to said extended memory area when executing an instruction in the first instruction group.

2. (Currently Amended) A microprocessor according to Claim 1, wherein each location in said addressable memory space is associated with a respective access address; and further comprising means for forcing an access address of a location to be accessed to point to a location in said lower memory area when executing an instruction in the first instruction group.

In re Patent Application of:
ROCHE ET AL.
Serial No. 10/814,823
Confirmation No. 5289
Filing Date: **March 31, 2004**

3. (Original) A microprocessor according to Claim 1, further comprising at least one internal register; and wherein the second instruction group comprises:

jump and routine call instructions at an arbitrary memory location in said addressable memory space; and
data transfer instructions between the arbitrary memory location and said at least one internal register.

4. (Original) A microprocessor according to Claim 1, wherein each location in said addressable memory space is associated with a respective access address; and for executing jump or routine call instructions from the first instruction group in a direct addressing mode from a location in said lower memory area, the microprocessor further comprises means for maintaining an address of a jump destination location so that it points to a location in said lower memory area.

5. (Original) A microprocessor according to Claim 1, wherein the first instruction group comprises indirect mode addressing instructions for accessing a location in said lower memory area; and further comprising means for forcing an address and a value of a pointer that specifies access in the indirect mode so that the pointer is located in said lower memory area and points to this area.

6. (Original) A microprocessor according to Claim 1, wherein the second instruction group comprises instructions for accessing said extended memory area in an indirect addressing mode.

_____ /

7. (Original) A microprocessor according to Claim 6, wherein in the indirect addressing mode of said extended memory area, pointers that determine an address of a memory location to be accessed are located in said lower memory area.

8. (Original) A microprocessor according to Claim 6, wherein in the indirect addressing mode of said extended memory area, pointers that determine an address of a memory location to be accessed are located within said extended memory area.

9. (Original) A microprocessor according to Claim 1, wherein said means for connecting to and accessing said addressable memory space comprises an address bus; and further comprising a program pointer register having a size corresponding to a size of said address bus for enabling access to a program instruction to be executed that is located at an arbitrary location in said addressable memory space.

10. (Original) A microprocessor according to Claim 1, wherein said lower memory area is accessible over 16 bits and said extended memory area is accessible over 24 bits.

11. (Currently Amended) A microprocessor comprising:
a processing unit;
a memory connected to said processing unit and comprising an addressable memory space for a lower memory area and an extended memory area;

In re Patent Application of:
ROCHE ET AL.
Serial No. 10/814,823
Confirmation No. 5289
Filing Date: March 31, 2004

an address bus connected to said memory; and
an instruction set ~~for accessing said addressable~~
~~memory space~~ executable by said processing unit, the
instruction set comprising

a first instruction group comprising
instructions for accessing said lower memory area,
and

a second instruction group distinct from the
first instruction group ~~for gathering and only~~
comprising all of the instructions in the
~~instruction set~~ for accessing said extended memory
~~area,~~ area; and

~~instructions means~~ means for preventing access to
said extended memory area when executing an instruction in the
first instruction group.

12. (Currently Amended) A microprocessor according
to Claim 11, wherein each location in said addressable memory
space is associated with a respective access address; and
~~wherein said instruction set further comprises instructions~~
means for forcing an access address of a location to be
accessed to point to a location in said lower memory area when
executing an instruction in the first instruction group.

13. (Original) A microprocessor according to Claim
11, further comprising at least one internal register; and
wherein the second instruction group comprises:

jump and routine call instructions at an arbitrary
memory location in said addressable memory space; and
data transfer instructions between the arbitrary

memory location and said at least one internal register.

14. (Original) A microprocessor according to Claim 11, wherein each location in said addressable memory space is associated with a respective access address; and for executing jump or routine call instructions from the first instruction group in a direct addressing mode from a location in said lower memory area, said instruction set further comprises instructions for maintaining an address of a jump destination location so that it points to a location in said lower memory area.

15. (Original) A microprocessor according to Claim 11, wherein the first instruction group comprises indirect mode addressing instructions for accessing a location in said lower memory area; and wherein said instruction set further comprises instructions for forcing an address and a value of a pointer that specifies access in the indirect mode so that the pointer is located in said lower memory area and points to this area.

16. (Original) A microprocessor according to Claim 11, wherein the second instruction group comprises instructions for accessing said extended memory area in an indirect addressing mode.

17. (Original) A microprocessor according to Claim 16, wherein in the indirect addressing mode of said extended memory area, pointers that determine an address of a memory location to be accessed are located in said lower memory area.

18. (Original) A microprocessor according to Claim 16, wherein in the indirect addressing mode of said extended memory area, pointers that determine an address of a memory location to be accessed are located within said extended memory area.

19. (Original) A microprocessor according to Claim 11, further comprising a program pointer register having a size corresponding to a size of said address bus for enabling access to a program instruction to be executed that is located at an arbitrary location in said addressable memory space.

20. (Original) A microprocessor according to Claim 11, wherein said lower memory area is accessible over 16 bits and said extended memory area is accessible over 24 bits.

21. (Currently Amended) A method for accessing a memory used by a microprocessor, the microprocessor comprising a processing unit, an address bus connected to the processing unit, with the memory being connected to the address bus and comprising an addressable memory space for a lower memory area and an extended memory area, the method comprising:

executing an instruction for accessing the lower memory area, the instruction belonging to an instruction set comprising a first instruction group comprising instructions for accessing the lower memory area, and a second instruction group distinct from the first instruction group and only comprising all of the instructions for accessing the extended memory area;

~~accessing the lower memory area using a first instruction group;~~
~~gathering instructions in the instruction set for accessing the extended memory area; and~~
preventing access to the extended memory area when executing the first instruction group.

22. (Currently Amended) A method according to Claim 21, wherein each location in the addressable memory space is associated with a respective access address; and further comprising ~~instructions for~~ forcing an access address of a location to be accessed to point to a location in the lower memory area when executing an instruction in the first instruction group.

23. (Currently Amended) A method according to Claim 21, wherein the microprocessor further comprising comprises at least one internal register; and wherein the second instruction group comprises:

jump and routine call instructions at an arbitrary memory location in the addressable memory space; and

data transfer instructions between the arbitrary memory location and the at least one internal register.

24. (Original) A method according to Claim 21, wherein each location in the addressable memory space is associated with a respective access address; and for executing jump or routine call instructions from the first instruction group in a direct addressing mode from a location in the lower memory area, further comprising maintaining an address of a

jump destination location so that it points to a location in the lower memory area.

25. (Original) A method according to Claim 21, wherein the first instruction group comprises indirect mode addressing instructions for accessing a location in the lower memory area; and further comprising forcing an address and a value of a pointer that specifies access in the indirect mode so that the pointer is located in the lower memory area and points to this area.

26. (Original) A method according to Claim 21, wherein the second instruction group comprises instructions for accessing the extended memory area in an indirect addressing mode.

27. (Original) A method according to Claim 26, wherein in the indirect addressing mode of the extended memory area, pointers that determine an address of a memory location to be accessed are located in the lower memory area.

28. (Original) A method according to Claim 26, wherein in the indirect addressing mode of the extended memory area, pointers that determine an address of a memory location to be accessed are located within the extended memory area.

29. (Original) A method according to Claim 21, wherein the microprocessor further comprises a program pointer register having a size corresponding to a size of the address bus for enabling access to a program instruction to be
